Domain	

Audit Updates

Initial Audit	16th February 2022
Corrected phase 1	18th February 2022
Corrected phase 2	21th February 2022

Contract Analysis

Critical Medium Minor Pass

Severity	Code	Description
●	ST	Contract Owner is not able to stop or pause transactions
●	OCTD	Contract Owner is not able to transfer tokens from specific address
●	OTUT	Owner Transfer User's Tokens
●	ELFM	Contract Owner is not able to increase fees more than a reasonable percent (25%)
●	ULTW	Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent
●	MT	Contract Owner is not able to mint new tokens
●	BT	Contract Owner is not able to burn tokens from specific wallet
●	BC	Contract Owner is not able to blacklist wallets from selling

ST - Stop Transactions

Criticality	medium
Location	contract.sol#L1027

Description

The contract owner has the authority to stop transactions for all users excluding the owner. The owner may take advantage of it by setting the `tradingActive` to false.

```
require(tradingActive || (_isExcludedFromFee[sender] ||
_isExcludedFromFee[recipient]), "Trading is currently not active");
```

Recommendation

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

BC - Blacklisted Contracts

Criticality	medium
Location	contract.sol#L1024

Description

The contract owner has the authority to stop contracts from transactions. The owner may take advantage of it by calling the `addBotToBlacklist` function.

```
require(!_isBlackListedBot[sender], "You are blacklisted");
require(!_isBlackListedBot[msg.sender], "You are blacklisted");
require(!_isBlackListedBot[tx.origin], "You are blacklisted");
```

Recommendation

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

Contract Diagnostics

Critical Medium Minor

Severity	Code	Description
	MT	Misleading Terminology
	FSA	Fixed Swap Address
	CO	Code Optimization
	DSM	Data Structure Misuse
	L01	Public Function could be Declared External
	L02	State Variables could be Declared Constant
	L05	Unused State Variable
	L04	Conformance to Solidity Naming Conventions
	L09	Dead Code Elimination
	L07	Missing Events Arithmetic
	L13	Divide before Multiply Operation

ME - Missing Events

Criticality	minor
Location	contract.sol#L1133

Description

In the _transferStandard() function, the contract emits an event that notifies about the team fee. Since the team fee emits an event there, the same event should be emitted in all the cases. Currently, the event is missing from _transferToExcluded(), _transferFromExcluded(), and _transferBothExcluded().

```
_takeTeam(tTeam);
_reflectFee(rFee, tFee);
emit Transfer(sender, recipient, tTransferAmount);
emit Transfer(sender, address(this), tTeam);
```

Recommendation

The smart contract should emit about the “team” fee event in all the usages. It would be better to move the emit inside the _takeTeam() function.

MT - Misleading Terminology

Criticality	minor
Location	contract.sol#L1199,1204

Description

The taxFee is added to the teamFee variable. The functionality of the “reflection” fee is misleading since the fees are not going to reflections.

```
uint256 tFee = 0;
uint256 tTeam = tAmount.mul(teamFee.add(taxFee)).div(100);
uint256 tTransferAmount = tAmount.sub(tFee).sub(tTeam);
```

Recommendation

The “reflection” fee should be renamed to “extra team fee”.

FSA - Fixed Swap Address

Criticality	minor
Location	contract.sol#L805

Description

The swap address is assigned once in the constructor and it can not be changed. The decentralized swaps sometimes create a new swap version or abandon the current. A contract that cannot change the swap address may not be able to catch-up the upgrade.

```
IUniswapV2Router02 _uniswapV2Router =
IUniswapV2Router02(0x10ED43C718714eb63d5aA57B78B54704E256024E);
// Create a uniswap pair for this new token
uniswapV2Pair = IUniswapV2Factory(_uniswapV2Router.factory())
    .createPair(address(this), _uniswapV2Router.WETH());

// set the rest of the contract variables
uniswapV2Router = _uniswapV2Router;
```

Recommendation

It could be better to allow the swap address mutation in case of future swap updates.

CO - Code Optimization

Criticality	minor
Location	contract.sol#L1197

Description

There are code segments that could be optimized. A segment may be optimized so that it becomes a smaller size, consumes less memory, executes more rapidly, or performs fewer operations.

For instance, the variable tFee is always fixed to zero. The variable tFee represents the “reflection” fee. Hence, the entire reflection functionality is redundant.

```
function _getTValues(uint256 tAmount, uint256 taxFee, uint256 teamFee, uint256
buyTaxFee, uint256 buyTeamFee) private view returns (uint256, uint256, uint256)
{
    if(msg.sender == address(uniswapV2Router)){ // buy
        uint256 tFee = 0;
        uint256 tTeam = tAmount.mul(buyTeamFee.add(buyTaxFee)).div(100);
        uint256 tTransferAmount = tAmount.sub(tFee).sub(tTeam);
        return (tTransferAmount, tFee, tTeam);
    } else { // sell or send
        uint256 tFee = 0;
        uint256 tTeam = tAmount.mul(teamFee.add(taxFee)).div(100);
        uint256 tTransferAmount = tAmount.sub(tFee).sub(tTeam);
        return (tTransferAmount, tFee, tTeam);
    }
}
```

Recommendation

The entire reflection fee feature should be eliminated from the contract since it produces unnecessary gas.

DSM - Data Structure Misuse

Criticality	minor
Location	contract.sol#L914

Description

The contract uses the `_isBlackListedBot` and the `_blackListedBots` in order to store the blacklisted addresses. The `_blackListedBots` is not used anywhere in the contract. Hence, it merely produces unnecessary gas consumption.

```
function addBotToBlacklist (address account) external onlyOwner() {
    require(account != 0x10ED43C718714eb63d5aA57B78B54704E256024E, 'We cannot
blacklist UniSwap router');
    require (!_isBlackListedBot[account], 'Account is already blacklisted');
    _isBlackListedBot[account] = true;
    _blackListedBots.push(account);
}

function removeBotFromBlacklist(address account) external onlyOwner() {
    require (_isBlackListedBot[account], 'Account is not blacklisted');
    for (uint256 i = 0; i < _blackListedBots.length; i++) {
            if (_blackListedBots[i] == account) {
                _blackListedBots[i] = _blackListedBots[_blackListedBots.length -
1];
                _isBlackListedBot[account] = false;
                _blackListedBots.pop();
                break;
            }
    }
}
```

Recommendation

The `_blackListedBots` could be eliminated from the contract since it is not used.

L01 - Public Function could be Declared External

Criticality	minor
Location	contract.sol#L424,433,825,829,833,837,846,851,855,860 and 23 more

Description

Public functions that are never called by the contract should be declared external to save gas.

```
_getETHBalance
_getSwitchVar
_getMaxTxAmount
_getFutureFee
_getStakingFee
_getBuyUseFee
_getUseFee
_getBuyFutureFee
_getBuyMarketingFee
...
```

Recommendation

Use the external attribute for functions never called from the contract

L02 - State Variables could be Declared Constant

Criticality	minor
Location	contract.sol#L390

Description

Constant state variables should be declared constant to save gas.

```
_previousOwner
```

Recommendation

Add the constant attribute to state variables that never change.

L05 - Unused State Variable

Criticality	minor
Location	contract.sol#L390

Description

There are segments that contain unused state variables.

```
_previousOwner
```

Recommendation

Remove unused state variables.

L04 - Conformance to Solidity Naming Conventions

Criticality	minor
Location	contract.sol#L491,492,521,540,788,789,1237,1241,1246,1250 and 35 more

Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow _ at the beginning of the mixed_case match for private variables and unused parameters.

```
_numOfTokensToExchangeForTeam
_switch
_futureFeeWalletAddress
_stakingWalletAddress
_useCaseWalletAddress
_marketingWalletAddress
_decimals
_symbol
_name
...
```

Recommendation

Follow the Solidity naming convention.
https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions

L09 - Dead Code Elimination

Criticality	minor
Location	contract.sol#L364,324,334,349,359,271,298,18,231,247

Description

Functions that are not used in the contract, and make the code's size bigger.

```
mod
_msgData
sendValue
isContract
functionCallWithValue
functionCall
_functionCallWithValue
...
```

Recommendation

Remove unused functions.

L07 - Missing Events Arithmetic

Criticality	minor
Location	contract.sol#L888,1346,1354,1361,1368,1376,1384,1391,1414

Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
_maxTxAmount = maxTxAmount
_futureFee = futureFee
_stakingFee = stakingFee
_buyUseFee = buyUseFee
_useFee = useFee
_buyFutureFee = buyFutureFee
_buyMarketingFee = buyMarketingFee
_marketingFee = marketingFee
_tFeeTotal = _tFeeTotal.add(tAmount)
```

Recommendation

Emit an event for critical parameter changes.

L13 - Divide before Multiply Operation

Criticality	minor
Location	contract.sol#L1020,1093

Description

Performing divisions before multiplications may cause lose of prediction.

```
_futureFeeWalletAddress.transfer(amount.div(_totalFee).mul(_futureFee))
_useCaseWalletAddress.transfer(amount.div(_totalFee).mul(_useFee))
_futureFeeWalletAddress.transfer(amount.div(_buyTotalFee).mul(_buyFutureFee))
_marketingWalletAddress.transfer(amount.div(_totalFee).mul(_marketingFee))
_useCaseWalletAddress.transfer(amount.div(_buyTotalFee).mul(_buyUseFee))
_marketingWalletAddress.transfer(amount.div(_buyTotalFee).mul(_buyMarketingFee))
takeStakingReward = amount.div(100).mul(_stakingFee)
```

Recommendation

The multiplications should be prior to the divisions.

The domain has been created 2 months before the creation of the audit. It will expire in 10 months.

There is no public billing information, the creator is protected by the privacy settings.

Summary

In the scope of the audit we focus on security, performance optimizations and business logic recommendations.

There are some functions that can be abused by the owner, like blacklisting addresses and stopping transactions. A multi-wallet signing pattern will provide security against potential hacks. Temporarily locking the contract or renouncing ownership will eliminate all the contract threats.

About Coinscope

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Coinscope is aiming to make crypto discoverable and efficient globally. It provides all the essential tools to assist users draw their own conclusions.
