Audit Updates

Initial Audit	20th March 2022
Corrected	

Contract Analysis

● Critical ● Medium ● Minor ● Pass

Severity	Code	Description
●	ST	Contract Owner is not able to stop or pause transactions
●	OCTD	Contract Owner is not able to transfer tokens from specific address
●	OTUT	Owner Transfer User's Tokens
●	ELFM	Contract Owner is not able to increase fees more than a reasonable percent (25%)
●	ULTW	Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent
●	MT	Contract Owner is not able to mint new tokens
●	BT	Contract Owner is not able to burn tokens from specific wallet
●	BC	Contract Owner is not able to blacklist wallets from selling

Contract Diagnostics

● Critical ● Medium ● Minor

Severity	Code	Description
●	BLC	Business Logic Concern
●	FSA	Fixed Swap Address
●	CO	Code Optimization
●	L01	Public Function could be Declared External
●	L02	State Variables could be Declared Constant
●	L04	Conformance to Solidity Naming Conventions
●	L05	Unused State Variable
●	L07	Missing Events Arithmetic
●	L09	Dead Code Elimination
●	L13	Divide before Multiply Operation

BLC - Business Logic Concern

Criticality	minor
Location	contract.sol#L1135

Description

The business logic seems peculiar. The implementation may not follow the expected behavior.

The fromAddress and toAddress are class properties. That means that their value persists across transfers. Hence, the setShare is called with the addresses of the previous transfer instead of the current.

```
if (shouldSetInviter) {
    inviter[to] = from;
}
if (fromAddress == address(0))fromAddress = from;
if (toAddress == address(0))toAddress = to;
if (!isDividendExempt[fromAddress] && fromAddress != uniswapV2Pair)
    setShare(fromAddress);
if (!isDividendExempt[toAddress] && toAddress != uniswapV2Pair)
    setShare(toAddress);

fromAddress = from;
toAddress = to;
```

Recommendation

The team is advised to carefully check if the implementation follows the expected business logic.

FSA - Fixed Swap Address

Criticality	minor
Location	contract.sol#L915

Description

The swap address is assigned once in the constructor and it can not be changed. The decentralized swaps sometimes create a new swap version or abandon the current. A contract that cannot change the swap address may not be able to catch-up the upgrade.

```
IUniswapV2Router02 _uniswapV2Router = IUniswapV2Router02(  
    0x10ED43C718714eb63d5aA57B78B54704E256024E  
);  
  
// Create a uniswap pair for this new token  
uniswapV2Pair =  
    IUniswapV2Factory(_uniswapV2Router.factory()).createPair(address(this),  
    USDTAddress);
```

Recommendation

It could be better to allow the swap address mutation in case of future swap updates.

CO - Code Optimization

Criticality	minor
Location	contract.sol#L1293

Description

There are code segments that could be optimized. A segment may be optimized so that it becomes a smaller size, consumes less memory, executes more rapidly, or performs fewer operations.

- The *accurRate* is calculated in the loop even if the result does not affected by the flow. The *accurRate* number is always fixed to 700.
- The total fees that are added to the cur balance are fixed to 7%.
- The loop is executed even if the cur does not exist in the inviter map.

```
for (int256 i = 0; i < 7; i++) {
    uint256 rate;
    if (i == 0) {
        rate = 300;
    } else if (i == 1 || i == 2){
        rate = 100;
    } else {
        rate = 50;
    }
    cur = inviter[cur];
    if (cur == address(0)) {
        break;
    }
    accurRate = accurRate.add(rate);

    uint256 curTAmount = tAmount.div(10000).mul(rate);
    _tOwned[cur] = _tOwned[cur].add(curTAmount);
    emit Transfer(sender, cur, curTAmount);
}
```

Recommendation

Rewrite some code segments so the runtime will be more performant.

Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>

L05 - Unused State Variable

Criticality

minor

Location

contract.sol#L88,89

Description

There are segments that contain unused state variables.

```
_lockTime  
_previousOwner
```

Recommendation

Remove unused state variables.

L07 - Missing Events Arithmetic

Criticality

minor

Location

contract.sol#L1379,1383,1387,1391

Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
dividendsMinAmount = _dividendsMinAmount  
minPeriod = _minPeriod  
distributorGas = _distributorGas  
minTokenNumberToSell = _minTokenNumberToSell
```

Recommendation

Emit an event for critical parameter changes.

L09 - Dead Code Elimination

Criticality	minor
Location	contract.sol#L314,343,357,288,458,449,417

Description

Functions that are not used in the contract, and make the code's size bigger.

```
safeTransferFrom  
safeIncreaseAllowance  
safeDecreaseAllowance  
sendValue  
functionCallWithValue  
functionCall
```

Recommendation

Remove unused functions.

L13 - Divide before Multiply Operation

Criticality

minor

Location

contract.sol#L1275,1399

Description

Performing divisions before multiplications may cause lose of prediction.

```
Transfer(sender,recipient,tAmount.div(10000).mul(recipientRate))
_tOwned[recipient] =
_tOwned[recipient].add(tAmount.div(10000).mul(recipientRate))
_takeTaxFee(sender,tAmount.div(10000).mul(_taxFee))
_takeLPFee(sender,tAmount.div(10000).mul(_LPFee))
_takeburnFee(sender,tAmount.div(10000).mul(_burnFee))
curTAmount = tAmount.div(10000).mul(rate)
Transfer(sender,address(this),tAmount.div(10000).mul(_inviterFee.sub(accurRate))
)
_tOwned[address(this)] =
_tOwned[address(this)].add(tAmount.div(10000).mul(_inviterFee.sub(accurRate)))
Transfer(sender,address(this),tAmount.div(10000).mul(_inviterFee))
...
```

Recommendation

The multiplications should be prior to the divisions.

The domain has been created about 2 days before the creation of the audit. It will expire in 12 months.

There is no public billing information, the creator is protected by the privacy settings.

Summary

The Smart Contract analysis reported no compiler error or critical issues. The contract Owner can access some admin functions that can not be used in a malicious way to disturb the users' transactions. There is also a fixed fee of 13%.

About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provides all the essential tools to assist users draw their own conclusions.
