Audit Updates

Initial Audit	27th April 2022
Corrected	

Contract Analysis

● Critical ● Medium ● Minor ● Pass

Severity	Code	Description
●	ST	Contract Owner is not able to stop or pause transactions
●	OCTD	Contract Owner is not able to transfer tokens from specific address
●	OTUT	Owner Transfer User's Tokens
●	ELFM	Contract Owner is not able to increase fees more than a reasonable percent (25%)
●	ULTW	Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent
●	MT	Contract Owner is not able to mint new tokens
●	BT	Contract Owner is not able to burn tokens from specific wallet
●	BC	Contract Owner is not able to blacklist wallets from selling

ST - Stop Transactions

Criticality	critical
Location	contract.sol#L561

Description

The contract owner has the authority to stop the sales or buys for all users excluding the owner. The owner may take advantage of it by setting the numerator denominator to the same value.

```
uint256 feeAmount = amount.mul(totalSellFee).div(feeDenominator);  
_balances[address(this)] = _balances[address(this)].add(feeAmount);
```

Recommendation

Read more about the fees manipulation in the [corresponding section](#).

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

ELFM - Exceed Limit Fees Manipulation

Criticality	critical
Location	contract.sol#L732

Description

The contract owner has the authority to increase over the allowed limit of 25%. The owner may take advantage of it by setting a smaller value to the dominator in comparison to the enumerator.

```
function setSellFees(uint256 _liquidityFee, uint256 _marketingFee, uint256
_opsFee, uint256 _rewardsFee, uint256 _feeDenominator) external authorized {
    sellFeeLiquidity = _liquidityFee;
    sellFeeMarketing = _marketingFee;
    sellFeeOps = _opsFee;
    sellFeeRewards = _rewardsFee;
    totalSellFee =
    _liquidityFee.add(_marketingFee).add(_opsFee).add(_rewardsFee);
    feeDenominator = _feeDenominator;
    require(totalSellFee <= maxFee, "Fees cannot be higher than 30%");

    emit SellFeesChanged(_liquidityFee, _marketingFee, _opsFee, _rewardsFee);
}
```

Recommendation

The contract could embody a check for the maximum acceptable value.

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

BC - Blacklisted Contracts

Criticality	critical
Location	contract.sol#L486

Description

The contract owner has the authority to massively stop contacts from transactions. The owner may take advantage of it by calling the `manage_blacklist` function.

```
require(!isBlacklisted[sender] && !isBlacklisted[recipient], "Blacklisted");
```

Recommendation

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

Contract Diagnostics

● Critical ● Medium ● Minor

Severity	Code	Description
●	L01	Public Function could be Declared External
●	L02	State Variables could be Declared Constant
●	L04	Conformance to Solidity Naming Conventions
●	L07	Missing Events Arithmetic
●	L11	Unnecessary Boolean equality
●	L14	Uninitialized Variables in Local Scope

L01 - Public Function could be Declared External

Criticality	minor
Location	contract.sol#L74,78,90,817

Description

Public functions that are never called by the contract should be declared external to save gas.

```
getCirculatingSupply  
transferOwnership  
unauthorize  
authorize
```

Recommendation

Use the external attribute for functions never called from the contract.

L02 - State Variables could be Declared Constant

Criticality	minor
Location	contract.sol#L169,182,347,348,354,398

Description

Constant state variables should be declared constant to save gas.

```
maxFee
_totalSupply
ZERO
DEAD
dividendsPerShareAccuracyFactor
WBNB
```

Recommendation

Add the constant attribute to state variables that never change.

L04 - Conformance to Solidity Naming Conventions

Criticality

minor

Location

contract.sol#L105,207,160,168,169,601,679,688,694,720,732,744,752,761,768,346,347,348,350,351,352,356,357,362

Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow `_` at the beginning of the `mixed_case` match for private variables and unused parameters.

```
_markerPairs
_maxWalletAmount
_maxTxAmount
_decimals
_symbol
_name
ZERO
DEAD
WBNB
...
```

Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>

L07 - Missing Events Arithmetic

Criticality

minor

Location

contract.sol#L207

Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
minPeriod = _minPeriod
```

Recommendation

Emit an event for critical parameter changes.

L11 - Unnecessary Boolean equality

Criticality

minor

Location

contract.sol#L601

Description

The comparison to boolean constants is redundant. Boolean constants can be used directly and do not need to be compared to true or false.

```
require(bool,string)(tradingEnabled == false,Can't pause trading)
```

Recommendation

Remove the equality to the boolean constant.

L14 - Uninitialized Variables in Local Scope

Criticality

minor

Location

contract.sol#L681

Description

These are variables that are defined in the local scope and are not initialized.

```
i
```

Recommendation

All the local scoped variables should be initialized.

Summary

There are some functions that can be abused by the owner, like manipulating fees, stopping transactions and blacklisting contracts. The contract can be converted into a honeypot and prevent users from selling if the owner abuses the admin functions. The maximum fee percentage that can be set is 25%. A multi-wallet signing pattern will provide security against potential hacks. Temporarily locking the contract or renouncing ownership will eliminate all the contract threats.

About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provides all the essential tools to assist users draw their own conclusions.
