Audit Updates

Initial Audit	31st March 2022
Corrected	

Contract Analysis

● Critical ● Medium ● Minor ● Pass

Severity	Code	Description
●	ST	Contract Owner is not able to stop or pause transactions
●	OCTD	Contract Owner is not able to transfer tokens from specific address
●	OTUT	Owner Transfer User's Tokens
●	ELFM	Contract Owner is not able to increase fees more than a reasonable percent (25%)
●	ULTW	Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent
●	MT	Contract Owner is not able to mint new tokens
●	BT	Contract Owner is not able to burn tokens from specific wallet
●	BC	Contract Owner is not able to blacklist wallets from selling

ULTW - Unlimited Liquidity to Team Wallet

Criticality	minor
Location	contract.sol#L732

Description

The contract owner has the authority to transfer funds without limit to the team wallet. These funds have been accumulated from fees collected from the contract. The owner may take advantage of it by setting a high fee to the `marketingFee` variable.

```
function withdrawAllToTreasury() external swapping onlyOwner {  
  
    uint256 amountToSwap = _gonBalances[address(this)].div(_gonsPerFragment);  
    require( amountToSwap > 0, "There is no EDInu token deposited in token  
contract");  
    address[] memory path = new address[](2);  
    path[0] = address(this);  
    path[1] = router.WETH();  
    router.swapExactTokensForETHSupportingFeeOnTransferTokens(  
        amountToSwap,  
        0,  
        path,  
        treasuryReceiver,  
        block.timestamp  
    );  
}
```

Recommendation

The contract could embody a check for the maximum amount of funds that can be swapped. Since a huge amount may violate the token's price.

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

Contract Diagnostics

● Critical ● Medium ● Minor

Severity	Code	Description
●	MTS	Manipulate Total Supply
●	CO	Code Optimization
●	L01	Public Function could be Declared External
●	L02	State Variables could be Declared Constant
●	L04	Conformance to Solidity Naming Conventions
●	L05	Unused State Variable
●	L09	Dead Code Elimination
●	L13	Divide before Multiply Operation
●	L14	Uninitialized Variables in Local Scope

MTS - Manipulate Total Supply

Criticality	minor
Location	contract.sol#L639

Description

The contract is manipulating the total supply. This change will have a direct impact on the token price and Market Cap.

```
for (uint256 i = 0; i < times; i++) {  
    _totalSupply = _totalSupply  
        .mul((10**RATE_DECIMALS).add(rebaseRate))  
        .div(10**RATE_DECIMALS);  
}
```

Recommendation

The contract owner should carefully manage the adjustment of the circulating supply (increases or decreases), according to the token's price fluctuations.

CO - Code Optimization

Criticality	minor
Location	contract.sol#L518

Description

The algorithmic flow does not follow the required business logic.

In the following statement the third and the forth **if** will never be fulfilled since an unsigned integer is either less than or greater/equal to 365 days. Hence, always the first two **if** statements will be fulfilled.

```
if (deltaTimeFromInit < (365 days)) {
    rebaseRate = 2355;
} else if (deltaTimeFromInit >= (365 days)) {
    rebaseRate = 211;
} else if (deltaTimeFromInit >= ((15 * 365 days) / 10)) {
    rebaseRate = 14;
} else if (deltaTimeFromInit >= (7 * 365 days)) {
    rebaseRate = 2;
}
```

Recommendation

Rewrite some code segments so the runtime will be more performant.

L01 - Public Function could be Declared External

Criticality

minor

Location

contract.sol#L349,362,367,393,397,401,884,903

Description

Public functions that are never called by the contract should be declared external to save gas.

```
setPairAddress  
getLiquidityBacking  
decimals  
symbol  
name  
transferOwnership  
renounceOwnership  
owner
```

Recommendation

Use the external attribute for functions never called from the contract

L02 - State Variables could be Declared Constant

Criticality

minor

Location

contract.sol#L443,434,444,415,413,414,441,436,432,435 and 2 more

Description

Constant state variables should be declared constant to save gas.

```
treasuryFee  
swapEnabled  
sellFee  
liquidityFee  
firePitFee  
feeDenominator  
_symbol  
_name  
_decimals  
...
```

Recommendation

Add the constant attribute to state variables that never change.

L04 - Conformance to Solidity Naming Conventions

Criticality

minor

Location

contract.sol#L151,152,169,189,781,790,853,873,874,875 and 20 more

Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow `_` at the beginning of the `mixed_case` match for private variables and unused parameters.

```
_totalSupply  
_lastAddLiquidityTime  
_lastRebasedTime  
_initRebaseStartTime  
_autoAddLiquidity  
_autoRebase  
EDInuInsuranceFundReceiver  
ZERO  
DEAD  
...
```

Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>

L05 - Unused State Variable

Criticality

minor

Location

contract.sol#L18

Description

There are segments that contain unused state variables.

```
MAX_INT256
```

Recommendation

Remove unused state variables.

L09 - Dead Code Elimination

Criticality

minor

Location

contract.sol#L46

Description

Functions that are not used in the contract, and make the code's size bigger.

```
abs
```

Recommendation

Remove unused functions.

L13 - Divide before Multiply Operation

Criticality

minor

Location

contract.sol#L509,619,884

Description

Performing divisions before multiplications may cause lose of prediction.

```
liquidityBalance = _gonBalances[pair].div(_gonsPerFragment)
_gonBalances[autoLiquidityReceiver] =
_gonBalances[autoLiquidityReceiver].add(gonAmount.div(feeDenominator).mul(liquidityFee))
_gonBalances[address(this)] =
_gonBalances[address(this)].add(gonAmount.div(feeDenominator).mul(_treasuryFee.add(EDInuInsuranceFundFee)))
_gonBalances[firePit] =
_gonBalances[firePit].add(gonAmount.div(feeDenominator).mul(firePitFee))
feeAmount = gonAmount.div(feeDenominator).mul(_totalFee)
times = deltaTime.div(900)
```

Recommendation

The multiplications should be prior to the divisions.

L14 - Uninitialized Variables in Local Scope

Criticality

minor

Location

contract.sol#L512

Description

There are variables that are defined in the local scope and are not initialized.

```
rebaseRate
```

Recommendation

All the local scoped variables should be initialized.

Summary

The token is an interesting project that has a friendly and growing community. The Smart Contract analysis reported no compiler error or critical issues. The Contract Owner can liquidate and withdraw the accumulated tokens. Other than that he can access some admin functions that can not be used in a malicious way to disturb the users' transactions. The maximum fee percentage that can be set is 14% in buys and 16% in sales.

About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provides all the essential tools to assist users draw their own conclusions.
