# Contract Analysis

● Critical   
 ● Medium   
 ● Minor   
 ● Pass

| Severity | Code | Description                                                                                                       |
|----------|------|-------------------------------------------------------------------------------------------------------------------|
| ●        | ST   | Contract Owner is not able to stop or pause transactions                                                          |
| ●        | OCTD | Contract Owner is not able to transfer tokens from specific address                                               |
| ●        | OTUT | Owner Transfer User's Tokens                                                                                      |
| ●        | ELFM | Contract Owner is not able to increase fees more than a reasonable percent (25%)                                  |
| ●        | ULTW | Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent |
| ●        | MT   | Contract Owner is not able to mint new tokens                                                                     |
| ●        | BT   | Contract Owner is not able to burn tokens from specific wallet                                                    |
| ●        | BC   | Contract Owner is not able to blacklist wallets from selling                                                      |

## MT - Mint Tokens

|                    |                  |
|--------------------|------------------|
| <b>Criticality</b> | medium           |
| <b>Location</b>    | henHouse.sol#L97 |

### Description

The contract owner has the authority to mint tokens. The owner may take advantage of it by calling the `mintTokensOnHalvingSchedule` function in specific periods of time. As a result the contract tokens will be inflated.

We state that the owner privileges are necessary and required for proper business logic handling. Thus, we emphasise the users should be careful since the contract balance will be inflated.

```
function mintTokensOnHalvingSchedule() external onlyHalvingManager(_msgSender())  
{...
```

### Recommendation

The owner should carefully manage the credentials of the owner's account. We advised considering an extra-strong security mechanism that the actions may be quarantined by many users instead of one. The owner could also renounce the contract ownership for a period of time or pass the access to the zero address.

# Contract Diagnostics

● Critical    ● Medium    ● Minor

| Severity | Code | Description                                |
|----------|------|--------------------------------------------|
| ●        | CO   | Code Optimization                          |
| ●        | L06  | Missing Events Access Control              |
| ●        | L01  | Public Function could be Declared External |
| ●        | L02  | State Variables could be Declared Constant |
| ●        | L04  | Conformance to Solidity Naming Conventions |

## CO - Code Optimization

|                    |                  |
|--------------------|------------------|
| <b>Criticality</b> | minor            |
| <b>Location</b>    | henHouse.sol#L49 |

### Description

There are code segments that could be optimized. A segment may be optimized so that it becomes a smaller size, consumes less memory, executes more rapidly, or performs fewer operations.

The antiBotTime variable is not initialized, thus the following expression will always yield false.

```
if (  
    antiBotTime > block.timestamp &&  
    amount > antiBotAmount &&  
    bots[sender]  
) {  
    revert("Anti Bot");  
}
```

### Recommendation

Rewrite some code segments so the runtime will be more performant.

## L06 - Missing Events Access Control

|                    |                  |
|--------------------|------------------|
| <b>Criticality</b> | minor            |
| <b>Location</b>    | henHouse.sol#L49 |

### Description

Detected missing events for critical access control parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
halvingManager = _hm
```

### Recommendation

Emit an event for critical parameter changes.

## L01 - Public Function could be Declared External

**Criticality**

minor

**Location**

HenHouseRouter.sol#L49,L205,L186 and 59 more

### Description

Public functions that are never called by the contract should be declared external to save gas.

```
setHalvingManager  
decreaseAllowance  
increaseAllowance  
...
```

### Recommendation

Use the external attribute for functions never called from the contract

## L02 - State Variables could be Declared Constant

|                    |                                            |
|--------------------|--------------------------------------------|
| <b>Criticality</b> | minor                                      |
| <b>Location</b>    | HenHouseRouter.sol#L22,L14,L40 and 12 more |

### Description

Constant state variables should be declared constant to save gas.

```
divPercent  
maxSupply  
antiBotTime  
...
```

### Recommendation

Add the constant attribute to state variables that never change.

## L04 - Conformance to Solidity Naming Conventions

|                    |                                            |
|--------------------|--------------------------------------------|
| <b>Criticality</b> | minor                                      |
| <b>Location</b>    | HenHouseRouter.sol#L73,L49,L89 and 35 more |

### Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow \_ at the beginning of the mixed\_case match for private variables and unused parameters.

```
_bots  
_hm  
_type  
...
```

### Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>

# Contract Functions

| Contract              | Type                        | Bases                              |            |                    |
|-----------------------|-----------------------------|------------------------------------|------------|--------------------|
|                       | Function Name               | Visibility                         | Mutability | Modifiers          |
|                       |                             |                                    |            |                    |

The domain has been created about 1 month before the creation of the audit. It will expire in 11 months.

There is no public billing information, the creator is protected by the privacy settings.

## Summary

The contract analysis reported no compiler errors and only one medium threat issue. The contract owner has the authority to mint tokens. We state that the owner privileges are necessary and required for proper business logic handling. Thus, we emphasise the users should be careful since some predefined wallets will receive many tokens and the contract balance will be inflated. As a result the value of the rest holders will be decreased. There are no functions that can be abused by the owner to interrupt the user's transactions.

## About Coinscope

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Coinscope is aiming to make crypto discoverable and efficient globally. It provides all the essential tools to assist users draw their own conclusions.
