Contract Review

Contract Name	NyanCat
Compiler Version	v0.8.6+commit.11564f7e
Optimization	200 runs
Licence	MIT
Explorer	https://bscscan.com/token/0xe0E76529561623EBa7160E6aF2A6C4cA36af4305
Symbol	NyanCat
Decimals	9
Total Supply	100,000
Source	contract.sol
Domain	nyancat.finance

Audit Updates

Initial Audit	11th March 2022
Corrected	

Contract Analysis

● Critical ● Medium ● Minor ● Pass

Severity	Code	Description
●	ST	Contract Owner is not able to stop or pause transactions
●	OCTD	Contract Owner is not able to transfer tokens from specific address
●	OTUT	Owner Transfer User's Tokens
●	ELFM	Contract Owner is not able to increase fees more than a reasonable percent (25%)
●	ULTW	Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent
●	MT	Contract Owner is not able to mint new tokens
●	BT	Contract Owner is not able to burn tokens from specific wallet
●	BC	Contract Owner is not able to blacklist wallets from selling

ELFM - Exceed Limit Fees Manipulation

Criticality	medium
Location	contract.sol#L929

Description

The contract owner has the authority to increase over the allowed limit of 25%. The owner may take advantage of it by calling the `setAllFeePercent` function with (9, 9, 9, 9, 9).

```
function setAllFeePercent(uint8 taxFee, uint8 liquidityFee, uint8 burnFee, uint8
walletFee, uint8 buybackFee) external onlyOwner() {
    require(taxFee >= 0 && taxFee <=maxTaxFee,"TF err");
    require(liquidityFee >= 0 && liquidityFee <=maxLiqFee,"LF err");
    require(burnFee >= 0 && burnFee <=maxBurnFee,"BF err");
    require(walletFee >= 0 && walletFee <=maxWalletFee,"WF err");
    require(buybackFee >= 0 && buybackFee <=maxBuybackFee,"BBF err");
    _taxFee = taxFee;
    _liquidityFee = liquidityFee;
    _burnFee = burnFee;
    _buybackFee = buybackFee;
    _walletFee = walletFee;
}
```

Recommendation

The contract could embody a check for the maximum acceptable value.

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

Contract Diagnostics

● Critical ● Medium ● Minor

Severity	Code	Description
●	FSA	Fixed Swap Address
●	MAL	Misused Algorithmic Logic
●	L01	Public Function could be Declared External
●	L02	State Variables could be Declared Constant
●	L04	Conformance to Solidity Naming Conventions
●	L09	Dead Code Elimination
●	L07	Missing Events Arithmetic
●	L08	Tautology or Contradiction
●	L13	Divide before Multiply Operation

FSA - Fixed Swap Address

Criticality	minor
Location	contract.sol#L801

Description

The swap address is assigned once in the constructor and it can not be changed. The decentralized swaps sometimes create a new swap version or abandon the current. A contract that cannot change the swap address may not be able to catch-up the upgrade.

```
IUniswapV2Router02 _pcsV2Router = IUniswapV2Router02(router);  
    // Create a uniswap pair for this new token  
pcsV2Pair = IUniswapV2Factory(_pcsV2Router.factory())  
    .createPair(address(this), _pcsV2Router.WETH());  
  
// set the rest of the contract variables  
pcsV2Router = _pcsV2Router;
```

Recommendation

It could be better to allow the swap address mutation in case of future swap updates.

MAL - Misused Algorithmic Logic (1/2)

Criticality

minor

Location

contract.sol#L1150,1156

Description

The contract accumulates the liquidity, burn, buyback and wallet fee on every transaction. When the accumulated value reaches a threshold, the `swapAndLiquify` is triggered. In the `swapAndLiquify` the proportional fees for burn and wallet are transferred to the corresponding address.

```
(burn fee + wallet fee) ->  
contract address ->  
swapAndLiquify() ->  
(burn address, wallet address)
```

Recommendation

The contract could transfer the burn and wallet tokens directly on every transaction. Hence an extra transfer step will be avoided.

```
(burn fee + wallet fee) ->  
(burn address, wallet address)
```

MAL - Misused Algorithmic Logic (2/2)

Criticality	medium
Location	contract.sol#L1160

Description

The contract converts tokens to BNB as part of the *swapAndLiquify* feature. The accumulated funds from the buyback fee are not transferred anywhere. Hence, the amount stacks in the contract.

```
if(_buybackFee != 0){  
    spentAmount = contractTokenBalance.div(totFee).mul(_buybackFee);  
    swapTokensForBNB(spentAmount);  
    totSpentAmount = totSpentAmount + spentAmount;  
}
```

Recommendation

The accumulated funds should not be stacked in the contract.

L01 - Public Function could be Declared External

Criticality	minor
Location	contract.sol#L499,508,514,519,527,815,819,823,827,836 and 16 more

Description

Public functions that are never called by the contract should be declared external to save gas.

```
recoverBEP20
isExcludedFromFee
setSwapAndLiquifyEnabled
buyBackUpperLimitAmount
includeInFee
excludeFromFee
excludeFromReward
reflectionFromToken
deliver
...
```

Recommendation

Use the external attribute for functions never called from the contract

L02 - State Variables could be Declared Constant

Criticality

minor

Location

contract.sol#L702,706,708,704,705,707,709,710,729,721

Description

Constant state variables should be declared constant to save gas.

```
router  
mintedByCryptoCravers  
minMxWalletPercentage  
minMxTxPercentage  
maxWalletFee  
maxTaxFee  
maxLiqFee  
maxBuybackFee  
maxBurnFee  
...
```

Recommendation

Add the constant attribute to state variables that never change.

L04 - Conformance to Solidity Naming Conventions

Criticality

minor

Location

contract.sol#L559,966,1031,1037,725,731,732,735,738,741 and 4 more

Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow `_` at the beginning of the `mixed_case` match for private variables and unused parameters.

```
_maxWalletAmount  
_maxTxAmount  
_buybackFee  
_walletFee  
_burnFee  
_liquidityFee  
_taxFee  
_symbol  
_name  
...
```

Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>

L09 - Dead Code Elimination

Criticality	minor
Location	contract.sol#L358,318,328,343,353,265,292,436,409,425 and 3 more

Description

Functions that are not used in the contract, and make the code's size bigger.

```
safeTransferFrom
safeTransfer
safeIncreaseAllowance
safeDecreaseAllowance
safeApprove
_callOptionalReturn
sendValue
isContract
functionCallWithValue
...
```

Recommendation

Remove unused functions.

L07 - Missing Events Arithmetic

Criticality

minor

Location

contract.sol#L931,948,952,959

Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
_maxWalletAmount = _tTotal.mul(maxWalletPercent).div(10 ** 2)
_maxTxAmount = _tTotal.mul(maxTxPercent).div(10 ** 2)
buyBackUpperLimit = buyBackLimit * 10 ** 18
_taxFee = taxFee
```

Recommendation

Emit an event for critical parameter changes.

L08 - Tautology or Contradiction

Criticality

minor

Location

contract.sol#L931

Description

Detects expressions that are tautologies or contradictions. For instance, an uint variable will always be greater than or equal to zero.

```
require(bool,string)(walletFee >= 0 && walletFee <= maxWalletFee,WF err)
require(bool,string)(burnFee >= 0 && burnFee <= maxBurnFee,BF err)
require(bool,string)(liquidityFee >= 0 && liquidityFee <= maxLiqFee,LF err)
require(bool,string)(buybackFee >= 0 && buybackFee <= maxBuybackFee,BBF err)
require(bool,string)(taxFee >= 0 && taxFee <= maxTaxFee,TF err)
```

Recommendation

Fix the incorrect comparison by changing the value type or the comparison.

L13 - Divide before Multiply Operation

Criticality

minor

Location

contract.sol#L1142

Description

Performing divisions before multiplications may cause lose of prediction.

```
spentAmount = contractTokenBalance.div(totFee).mul(_buybackFee)
spentAmount = contractTokenBalance.div(totFee).mul(_walletFee)
spentAmount = contractTokenBalance.div(totFee).mul(_burnFee)
```

Recommendation

The multiplications should be prior to the divisions.

Summary

The Smart Contract analysis reported one medium severity issue. The contract owner can increase the fee percentage to 45%. Additionally, the contract contains some business logic concerns. After a correct contract configuration, a multi-wallet signing pattern will provide security against potential hacks. Temporarily locking the contract or renouncing ownership will eliminate all the contract threats.

About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provides all the essential tools to assist users draw their own conclusions.
