## Audit Updates

<b>Initial Audit</b>	7th April 2022
<b>Corrected</b>	

# Contract Analysis

● Critical   ● Medium   ● Minor   ● Pass

Severity	Code	Description
●	ST	Contract Owner is not able to stop or pause transactions
●	OCTD	Contract Owner is not able to transfer tokens from specific address
●	OTUT	Owner Transfer User's Tokens
●	ELFM	Contract Owner is not able to increase fees more than a reasonable percent (25%)
●	ULTW	Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent
●	MT	Contract Owner is not able to mint new tokens
●	BT	Contract Owner is not able to burn tokens from specific wallet
●	BC	Contract Owner is not able to blacklist wallets from selling

## ST - Stop Transactions

Criticality	medium
Location	contract.sol#L571

### Description

The contract owner has the authority to stop transactions for all users excluding the owner. The owner may take advantage of it by setting the `tradingOpen` to false.

```
if (!authorizations[sender] && !authorizations[recipient]) {  
    require(tradingOpen, "Trading is not enabled");  
}
```

### Recommendation

The contract could prevent the toggle of `tradingOpen` once it is enabled.

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

## BC - Blacklisted Contracts

<b>Criticality</b>	medium
<b>Location</b>	contract.sol#L574

### Description

The contract owner has the authority to stop contracts from transactions. The owner may take advantage of it by calling the `setLocks` function.

```
if (lockingEnabled) {  
    require(!isLocked[sender] && !isLocked[recipient], "Wallet is locked");  
}
```

### Recommendation

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

# Contract Diagnostics

● Critical    ● Medium    ● Minor

Severity	Code	Description
●	L01	Public Function could be Declared External
●	L02	State Variables could be Declared Constant
●	L04	Conformance to Solidity Naming Conventions
●	L07	Missing Events Arithmetic
●	L13	Divide before Multiply Operation
●	L14	Uninitialized Variables in Local Scope

## L01 - Public Function could be Declared External

<b>Criticality</b>	minor
<b>Location</b>	contract.sol#L106,110,123,960

### Description

Public functions that are never called by the contract should be declared external to save gas.

```
tradingStatus  
transferOwnership  
unauthorize  
authorize
```

### Recommendation

Use the external attribute for functions never called from the contract

## L02 - State Variables could be Declared Constant

**Criticality**

minor

**Location**

contract.sol#L380,206

### Description

Constant state variables should be declared constant to save gas.

```
dividendsPerShareAccuracyFactor  
_totalSupply
```

### Recommendation

Add the constant attribute to state variables that never change.

## L04 - Conformance to Solidity Naming Conventions

<b>Criticality</b>	minor
<b>Location</b>	contract.sol#L141,188,870,882,886,927,928,929,936,960,377,378,379,380,382,383,385,386,418,429,437

### Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow \_ at the beginning of the mixed\_case match for private variables and unused parameters.

```
_feeWallets  
_multipliers  
_fees  
_maxHoldings  
_maxTxAmount  
_allowances  
_balances  
_totalSupply  
_decimals  
...
```

### Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>

## L07 - Missing Events Arithmetic

**Criticality**

minor

**Location**

contract.sol#L230,260,780,791,799,807,922,926,936,960

### Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
deadBlocks = _deadBlocks
targetLiquidity = _target
swapThreshold = _swapThreshold
distributorGas = gas
_maxTxAmount = amount
_maxTxAmount = (_totalSupply * percent) / base
_maxHoldings = amount
_maxHoldings = (_totalSupply * percent) / base
dividendsPerShare =
dividendsPerShare.add(dividendsPerShareAccuracyFactor.mul(msg.value).div(totalShares))
...
```

### Recommendation

Emit an event for critical parameter changes.

## L13 - Divide before Multiply Operation

**Criticality**

minor

**Location**

contract.sol#L842

### Description

Performing divisions before multiplications may cause lose of prediction.

```
fees =
_fees.total.mul(100).div(_fees.divisor).mul(_multipliers.sellMultiplier).div(_multipliers.divisor)
fees =
_fees.total.mul(100).div(_fees.divisor).mul(_multipliers.buyMultiplier).div(_multipliers.divisor)
```

### Recommendation

The multiplications should be prior to the divisions.

## L14 - Uninitialized Variables in Local Scope

**Criticality**

minor

**Location**

contract.sol#L766,639

### Description

There are variables that are defined in the local scope and are not initialized.

```
feeAmount  
i
```

### Recommendation

All the local scoped variables should be initialized.

## Summary

Token is an interesting project that has a friendly and growing community. There are some functions that can be abused by the owner, like stopping transactions and blacklisting wallets. The maximum fee percentage that can be set in sales and buys is 25%. The contract owner can set 100% fees in the transfers from wallet to wallet. A multi-wallet signing pattern will provide security against potential hacks. Temporarily locking the contract or renouncing ownership will eliminate all the contract threats.

## About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provides all the essential tools to assist users draw their own conclusions.
