## **Contract Analysis**

The migrate contract is responsible for transforming an legacy token to a new one.

The old and the new tokens are created once in the constructor and cannot be changed.

When a users calls the "migrate" method, the amount of his legacy tokens are moved to the migrator contract and the migrator contract sends him the corresponding amount of the new tokens.

# **Contract Diagnostics**

CriticalMediumMinor

| Severity | Code | Description                                |
|----------|------|--|
| •        | MC   | Missing Check                              |
| •        | L01  | Public Function could be Declared External |
| •        | L02  | State Variables could be Declared Constant |
| •        | L04  | Conformance to Solidity Naming Conventions |
| •        | L09  | Dead Code Elimination                      |

## MC - Missing Check

| Criticality | medium            |
|-------------|-------------------|
| Location    | contract.sol#L365 |

#### Description

The contract should check if the amount of the new token is enough to cover the old user's amount. Otherwise, the user may transfer his tokens without receiving the corresponding amount.

```
uint256 oldBalance;
oldBalance = oldToken.balanceOf(address(msg.sender));

oldToken.transferFrom(msg.sender, address(this), oldBalance);
newToken.transfer(msg.sender, oldBalance);
```

#### Recommendation

The contract should properly check the variables according to the required specifications

## L01 - Public Function could be Declared External

| Criticality | minor                             |
|-------------|-----------------------------------|
| Location    | contract.sol#L277,296,305,364,372 |

#### Description

Public functions that are never called by the contract should be declared external to save gas.

burnToken migrate transferOwnership renounceOwnership owner

#### Recommendation

Use the external attribute for functions never called from the contract

## L02 - State Variables could be Declared Constant

| Criticality | minor             |
|-------------|-------------------|
| Location    | contract.sol#L349 |

### Description

Constant state variables should be declared constant to save gas.

\_burnAddress

#### Recommendation

Add the constant attribute to state variables that never change.

# L04 - Conformance to Solidity Naming Conventions

| Criticality | minor                     |
|-------------|---------------------------|
| Location    | contract.sol#L356,357,349 |

### Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow \_ at the beginning of the mixed\_case match for private variables and unused parameters.

```
_burnAddress
_oldToken
_newToken
```

#### Recommendation

Follow the Solidity naming convention. https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions

## L09 - Dead Code Elimination

| Criticality | minor             |
|-------------|-------------------|
| Location    | contract.sol#L248 |

## Description

Functions that are not used in the contract, and make the code's size bigger.

\_msgSender

#### Recommendation

Remove unused functions.

# **Contract Functions**

## **Contract Flow**

# Summary

The migrator is a contract that is responsible for converting a legacy to a new token. This audit focuses on the correct functionality, the security concerns and some performance improvements.

## About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provides all the essential tools to assist users draw their own conclusions.
